Sequence 4, Application US/09929230

Patent No. US202020161203A1

GENERAL INFORMATION:

APPLICANT: Sheppard, Paul O.

APPLICANT: Sheppard, Paul D.

TITLE OF INVENTION: RATTLESNAKE VENOM GLAND PROTEINS

TITLE REPERENCE: 00-72

CURRENT APPLICATION NUMBER: US/09/929,230

CURRENT FILING DATE: 2001-08-13

SOFTWARE: FactSEQ for Windows Version 4.0

SEQ ID NO 4

LENGTH: 721
                                                                                                                                           TOPOLOGY: linear

Patent No. US20020161203A1
GENERAL INFORMATION:
APPLICANT: Sheppard, Paul O.
APPLICANT: Sheppard, Paul D.
TITLE OF INVENTION: RATTLESNAKE VENOM GLAND PROTEINS
FILE REFERENCE: 00-72
CURRENT APPLICATION NUMBER: US/09/929,230
CURRENT FILING DATE: 2001-08-13
NUMBER OF SEQ ID NOS: 14
SOFTWARE: FastSEQ for Windows Version 4.0
SEQ ID NO 12
LENGTH: 474
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               426

/note="Organ: venome glands, vector: pGEMILZE+; Site 1: Eco RI; Site 2: Not I; Sug of mRNA from Bothrops insularis venom glands were primed with oligo-(dT) and reverse transcribed to cDNA using Superscript Plasmid System for CDNA Synthesis and Cloning (LifeTechhologies). The cDNAs were selected by size (350-600 pb and up 600 pb) in agarose gel electrophoresis, linked to Eco RI adapters and directionally cloned in pGEMILZE+ vector (Promega). ESTs were generated from random clones and grouped in unique sequences. The putative identification of each EST or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            linear EST 01-MAY-2002

RI; Site 2: Not I; Sug of manA from Bothrops insularis
venom glands were primed with oligo-(dT) and reverse
transcribed to cDNA using Superscript Plasmid System for
cDNA Synthesis and Cloning (LifeTechnologies). The cDNAs
were selected by size (350-600 pb and up 600 pb) in
agarose gel electrophoresis, linked to Eco RI adapters and
directionally cloned in pGEMI12E; vector (Promega). ESTs
were generated from random clones and grouped in unique
sequences. The putative identification of each EST or
cluster was obtained through Blast searches (e-value <

transcribed to cDNA using Superscript Plasmid System for CDNA Synthesis and Cloning (LifeTechnologies). The cDNAs were selected by size (350-600 pb and up 600 pb) in agarose gel electrophoresis, linked to Eco RI adapters and directionally cloned in pGEMILIE+ vector (Promega). ESTs sequences. The putative identification of each EST or cluster was obtained through Blast searches (e-value

/note="Organ: venom glands, Vector: pGEMIJZF; Site 1: Eco
RI, Site 2: Not I; Sug of mRNA from Bothrops insularis
venom glands were primed with oligo-(dT) and reverse
transcribed to cDNA using Superscript Plasmid System for
cDNA Synthesis and Cloning (LifeTechnologies). The cDNAs
were selected by size (350-600 pb and up 600 pb) in
agarose gel electrophoresis, linked to Eco RI adapters and
directionally cloned in pGEMIJZF+ vector (Promega). ESTs
were generated from random clones and grouped in unique
sequences. The putative identification of each EST or
cluster was obtained through Blast searches (e-value <
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ó

/note="Organ: venom glands, vector: pGEMIJZE+; Site_1: Eco RI; Site_2: Not I: Sug of mRNA from Bothrops insularis venom glands were primed with oligo-(dT) and reverse transcribed to cDNA using Superscript Plasmid System for cDNA Synthesis and Cloning (LifeTechnologies). The cDNAs were selected by size (350-600 pb and up 600 pb) in agarose gel electrophoresis, linked to Eco RI adapters and directionally cloned in pGEMILZF+ vector (Promega). ESTE were generated from random clones and grouped in unique sequences. The putarive identification of each EST or cluster was obtained through Blast searches (e-value <

/note="Organ: venom glands, Vercor: pGEMIL2F; site l: Eco RI; Site 2: Not I: Sug of mRNA from Bothrops insularis venom glands were primed with oligo-(dT) and reverse transcribed to cDNA using Superscript Plasmid System for CDNA Synthesis and Cloning (LifeTechnologies). The cDNAs were selected by size (350-600 pb and up 600 pb) in agarose gel electrophoresis, linked to Eco RI adapters and directionally cloned in pGEMILZF+ vector (Promega). ESTs were generated from random clones and grouped in unique sequences. The putative identification of each EST or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        122
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AAGGGAGTTGTACAGGGTCTTNGAACAAAAGATGAACTGGNAGGATGCAGNGAAATTCTG 467

RI; Site_2: Not I; Sug of mRNA from Bothrops insularis venom glands were primed with oligo-(dT) and reverse transcribed to cDNA using Superscript Plasmid System for cDNA Synthesis and Cloning (LifeTechnologies). The cDNAs were selected by size (350-600 pb and up 600 pb) in agarose gel electrophoresis, linked to Eco RI adapters and directionally cloned in pGENLIZf, vector (Promega). ESTs were generated from random clones and grouped in unique sequences. The putative identification of each EST or cluster was obtained through Blast searches (e-value < 0 BM401653 453 bp mRNA linear EST 01-MAY-2002 JL2D01F Snake Bothrops insularis library IL3 Bothrops insularis cDNA 5' similar to Snake venom C-type lectin, mRNA sequence. 341 gaagiggagcgainachccagcgrcagthardagaaccrgghcgaggaaangrgaaaa 400 Eukaryota; Metazas, Chordata, Craniata; Vertebrata, Euteleostomi; Lepidosauria; Squamata; Scleroglossa; Serpentes; Colubroidea; Viperidae; Crotalinae; Bothrops.

Deinagkistrodon acutus antithrombosis enzyme alpha chain.

Antithrombosis, alpha chain; fibrin hydrolysis; blood clot; enzyme; platelet aggregation; vaso-occulusive disorder; thromboembolic disorder; myocardial infarction; restenosis; cancer; neurodegenerative disease; angiopathic thrombosis; cerebral thrombosis; thrombosis; obliterans; ischaemic cerebral vascular disease, unstable angina; acute thrombosis; unstable stenocardia; pulmonary embolism; deep vein thrombosis; oedema; peripheral arterial occulsion; stroke; atherosclerosis; inflammation; thrombosis

Deinagkistrodon acutus.

```
The invention relates to a new Deinagkistrodon actus anti-thrombosis enzyme, where the enzyme hydrolyses fibrin, dissolves blood clots and prevents platelet aggregation. The anti-thrombosis was administered to rabbits intravenusly. Thrombosis was determined before and after the administration at 0.5, 1.0, 2.0 and 3.0 hours by the cloudler method. The enzyme showed anti-thrombosis activity at 0.5 hour following administration at 0.050 micro/kg and this activity was increased significantly at 1.0 hour and at 0.01 micro /kg. The composition is useful for preventing and treating vaso-occulusive and thrombosition is useful for preventing and treating vaso-occulusive and thrombosition chrombosis, cerebral thrombosis, ischaemic cerebral vascular diseases, unstable angina, acute thrombosis, ischaemic cerebral vascular diseases, unstable angina, acute thrombosis, unstable stenocardia, thrombosiitis obliterans, pulmonary embolism, deep vein thrombosis, peripheral arterial occulsion, stroke. It is also useful for treating attentiosclarosis, occume and inflammation, cancer and neurodegenerative diseases. The present sequence represents the amino acid sequence of the perinagkistrodon acutus antithrombosis enzyme alpha chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            120

The invention relates to new pigmy rattlesnake (Sistrurus miliarius) venom gland proteins, which affect blood coagulation and platelet aggregation system. The polypeptides, which affect blood coagulation and platelet aggregation system, are useful in therapy and diagnostics. The polypeptides are also useful as an educational tool in laboratory protein chemistry and antibody production and analysis. The polypeptide can be used as standards or as unknowns polymucleotide or polypeptide can be used as standards or as unknowns to testing purposes. The polypeptides are also useful in identifying proteins by western blotting, protein purification, determining the weight of expressed polypeptides as a ratio to total protein expressed, identifying peptide cleavage sites, coupling amino and carboxyl terminal tagin, mass spectrometry, circular dichroism to determine conformation or affinity chromatography columns to purify the protein, cloning or sequencing. The present sequence is Sistrurus miliarius venom gland
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 SAKIHVWIGLRAQNKEKQCSIEWSDGSSISKENWIEEESKKCLGVHIETGFHKWENFYCE 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      24 DCPSGWSSYEGHCYNIFHLFKTWAEAERFCRKQVKGAHLVSIESSEEADFVAQLVSENMK
                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to halyxin, a novel protein with very strong blood anticoagulation activity. The protein was separated from snake venom of Agkistrodon halys brevicaudus (a Korean pit viper) and can be used in the treatment of thrombogenesis. The present sequence is the A chain of halyxin.
                                                                                                                                                                                                                                                                                                                                  Halyxin as blood anticoagulation protein separated from snake venom

The invention comprises the nucleotide and protein sequences of a salmorin protein derived from the venom of Korean adder. Salmorin protein is composed of an A chain and a B chain, and has inhibitory activity against fibrinogen clotting. The salmorin protein of the invention is useful for treating thrombosis, as it represses fibrinogen clotting potently by binding to prothrombin and thrombin so as to delay blood coagulation. The present amino acid sequence represents the Korean adder salmorin A chain protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AL-A may be obtd. from snake venom. It has a mol. wt. of about 45 kDa. AL-A contains two types of polypeptide chains, with mol. wt. of about 18 kDa and about 15 kDa, respectively. Each of these two types of chains is actually composed of two subtypes. Thus, AL-A comprises four non-identical polypeptide chains. A possible variation of AAR38224 has been found, characterised by Asp at posn. three in lieu
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New platelet-binding proteins obtained from snake venom - inhibit binding of von Willebrand factor to platelet membrane glycoprotein IB, useful in therapy, diagnosis and surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Botrocetin; alpha subunit; snake venom; Bothrops jararaca; von Willebrand factor; von Willebrand disease.
                                                                           polypeptide chain of alboaggregin A (AL-A)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               59.3%; Score 424; DB 14;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to new pigmy rattlesnake (Sistrurus miliarius)
venom gland proteins, which affect blood coagulation and platelet
aggregation system. The polypeptides, which affect blood coagulation and
platelet aggregation system, are useful in therapy and diagnostics. The
polypeptides are also useful as an educational tool in laboratory
practical kits for courses related to genetics and molecular biology,
protein chemistry and antibody production and analysis. The
polymucleotide or polypeptide can be used as standards or as unknowns
for testing purposes. The polypeptides are also useful in identifying
porties blotting, protein purification, determining the
weight of expressed polypeptides as ratio to total protein expressed,
identifying peptide cleavage sites, coupling amino and carboxyl terminal
tags, mass spectrometry, circular dichroism to determine conformation or
affinity chromatography columns to purify the protein, cloning or
sequencing. The present sequence is Sistrurus miliarius venom gland
protein, Zenk4.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      .

linked heterodimer comprising an alpha subunit (AAR45156) and a beta
subunit (AAR45157). The protein is used to assay von Willebrand
factor in serum or plasma, for diagnosis of von Willebrand disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents subunit A of the abylysantinfarctase thrombase I isolated from the snake venom of Chinese Agkistrodon acutus (Deinagkistrodon acutus). The present invention describes an anionic exchange column chromatographic process used to separate and purify, and the repurifying in a fast protein purifying work station, where snake venom of Chinese Agkistrodon acutus. The test shows that the Ahylysantinfarctase thrombase I consists of two subunits designated and a lee ABB79130 and ABB79131 respectively).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        59
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        1 DCSSDWSSYEGHCYKVFKQSKTWTDAESFCTKQVNGGHLVSIESSGEADFVGQLIAQKIK

                                                                                                                                                                                                                                                AL-A may be obtd. from snake venom. It has a mol. wt. of about 45 kDa. AL-A contains two types of polypeptide chains, with mol. wt. of about 18 KDa and about 15 KDa, respectively. Each of these two types of chains is actually composed of two subtypes. Thus, AL-A comprises four non-identical polypeptide chains. A possible variation of AAR38224 has been found, characterised by Asp at posn. three in lieu
                                                                                                                                                                                                  Gaps
Alboaggregin B1 and B2 (collectively "AL-B"), may be obtained in substantially pure chemical form from venom. Each of AL-B11 and -B2 comprise an about 23 kDa protein formed by an about 17 kDa polypeptide chain crosslinked to an about 14 kDa polypeptide chain crosslinked to an about 18 kDa polypeptide chain by one or more interchain disulfide bonds. Each of the two polypeptide chains of AL-B1 and -B2 show strong homology to two of the chains of AL-B1 and -B2 each comprise two non-identical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New platelet-binding proteins obtained from snake venom - inhibit binding of von Willebrand factor to platelet membrane glycoprotein IB, useful in therapy, diagnosis and surgery
                                                                                                                                                                                                    .

Bach of AL-B11 and -B2 comprise an about 17 kDa protein formed by an about 17 kDa polypeptide chain crosslinked to an about 14 kDa polypeptide chain crosslinked to an about 14 kDa polypeptide chain py one or more interchain disulfide bonds. Each of the two polypeptide chains of AL-B1 and -B2 show strong homology to two of the chains of AL-A. AL-B1 and -B2 each comprise two non-identical polypeptide chains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New platelet-binding proteins obtained from snake venom - inhibit binding of von Willebrand factor to platelet membrane glycoprotein IB, useful in therapy, diagnosis and surgery
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              7

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to new pigmy rattlesnake (Sistrurus miliarius) venom gland proteins, which affect blood coagulation and platelet aggregation system. The polypeptides, which affect blood coagulation and platelet aggregation system, are useful in therapy and diagnostics. The polypeptides are also useful as an educational tool in laboratory practical kits for courses related to genetics and molecular biology, protein chemistry and antibody production and analysis. The polymucleotide or polypeptide can be used as standards or as unknowns for testing purposes. The polypeptides are also useful in identifying proteins by western blotting, protein purification, determining the weight of expressed polypeptides as a ratio to total protein expressed,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New pigmy rattlesnake (Sistrurus miliarius) venom gland proteins, which affect blood coagulation and platelet aggregation system, useful in therapy and diagnostics, or as tools in the study of genetics or

A peptide compsn. comprising AAR72235 and AAR72236 is claimed, it inhibits the binding of platelets to von Willebrand factors and can therefore be used as an anti-thrombotic agent. (Updated on 25-MAR-2003 to correct PN field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Peptide derived from Vipera palestinae venom - inhibits binding of platelets to von Willebrand factor, useful as antithrombotic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Length 132;
                                                                                                                                                                                                                                                        Vipera palestinae, venom, antithrombotic agent, platelet binding, von Willebrand factor.

One chain type has a mol. wt. of about 15 kDa and the other has a mol. wt. of about 13 kDa. The individual polypeptide chains are held together by one or more interchain disulfide bonds.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                New platelet-binding proteins obtained from snake venom - inhibit binding of von Willebrand factor to platelet membrane glycoprotein IB, useful in therapy, diagnosis and surgery
                                                                                                                                                                                                                                          Sequence of polypeptide chain of alboaggregin-like protein called

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   AL-A may be obtd. from snake venom. It has a mol. wt. of about 45 kDa. AL-A contains two types of polypeptide chains, with mol. wt. of about 18 kDa and about 15 kDa, respectively. Each of these two types of chains is actually composed of two subtypes. Thus, AL-A comprises four non-identical polypeptide chains. A possible variation of AAR38224 has been found, characterised by Asp at posn. three in lieu
